Notes:
(a) According to Van Bruggen (1973), *Ecklon & Zeyher 107* (K) was collected at Uitenhage. There are no records in GRA, PEU and PRE of this taxon occurring so far up the east coast.
(b) PRE has a record of *A. distachyos* growing in a natural pool of a permanent stream near Starvation Creek, Berlin State Forest, M. This, no doubt, is a garden escape that has naturalised in that area.

Note: Horn af Rantzien (1961) described *T. milnei* from material collected from Tanzania, Angola, Zambia, Zimbabwe and one record from KwaZulu-Natal (*Rudatis 440*). Obermeyer (1966) regarded it as a synonym of *T. bulbosa*. Cook (2004) reinstated it as a taxon occurring in RSA. Since *Rudatis 440* seems to be 'temporary misplaced' Obermeyer (1966) will be followed until an in-depth study can be done.

(9) Cook. 2004. *Aquatic and wetland plants of southern Africa*: 259–263.

Notes: the taxon *X. capensis* is very variable and has been regarded as a complex of several species. Lock (1998, 1999a) reinstated *X. huillensis*, *X. rubella* and *X. straminea* as separate species for tropical East Africa, while Lisowski *et al.* (2001) recognised *X. straminea* but not *X. huillensis* for the Floras of Congo, Rwanda and Burundi. The southern African Xyridaceae are in need of a comprehensive revision. We recognise *X. rubella* and *X. huillensis*. *X. straminea* requires further investigation before a decision can be made as to whether this taxon should be recognised as distinct, and if so, at what level.

About SABONET

This publication is a product of the Southern African Botanical Diversity Network (SABONET), a programme aimed at strengthening the level of botanical expertise, expanding and improving herbarium and botanic garden collections, and fostering closer collaborative links among botanists in the southern African subcontinent.

The main objective of SABONET is to develop a strong core of professional botanists, taxonomists, horticulturists, and plant diversity specialists within the ten countries of southern Africa (Angola, Botswana, Lesotho, Malawi, Mozambique, Namibia, South Africa, Swaziland, Zambia, and Zimbabwe). This core group will be competent to inventory, monitor, evaluate and conserve the botanical diversity of the region in the face of specific development challenges, and to respond to the technical and scientific needs of the Convention on Biological Diversity.

To enhance the human resource capacity and infrastructure available in the region, SABONET offers training courses, workshops, and collaborative expeditions in under-collected areas. The programme produces a newsletter, SABONET News, and a series of occasional publications, the Southern African Botanical Diversity Network Report Series, of which this publication is part.

SABONET is co-funded by:

- The United States Agency for International Development (USAID/World Conservation Union—Regional Office for southern Africa (IUCN-ROSA)
- The Global Environment Facility (GEF)/United Nations Development Programme (UNDP)

With 19 581 indigenous species (infraspecific taxa excluded), 2 267 genera and 349 families of vascular plants, occurring on less than 3% of the world's total land surface, South Africa has the richest temperate flora in the world. It also contains a rich complement of endemic taxa– approximately 60% of the total flora.

This publication documents the flora of South Africa separately from the *Flora of southern Africa* region for the first time in many years. It is furthermore the first comprehensive listing of plant taxa that are endemic to South Africa.

For easy reference, family, genus and species names are given in alphabetical sequence within seven more-or-less natural assemblages: Bryophyta, Hepatophyta, Anthocerotophyta, Pteridophyta, Gymnosperms, Dicotyledons and Monocotyledons.

This book is an indispensable reference for South Africa botanists, students of botany and anyone interested in the South African flora.
